We love taking photos

Privacy concerns - and the wish to properly archive them for the next generation - brought us to the conclusion that existing cloud solutions are not the right tool to keep them organized.

That's why we started working on an easy-to-use application that can be hosted at home or on a private server.

Who we are

A growing community of top-class engineers and scientists based in Berlin, Germany

Andrea Ceroni

PhD in Computer Science,
wrote numerous papers
related to personal photo
management and machine
learning

Theresa Gresch

Master's in Neurobiology,
product manager with an
eye for usability and
design, experienced in
working with startups

Michael Mayer

Interim CTO & Consultant,
20+ years of experience in
building Web applications,
started his first open
source project in the 90s

...and many more

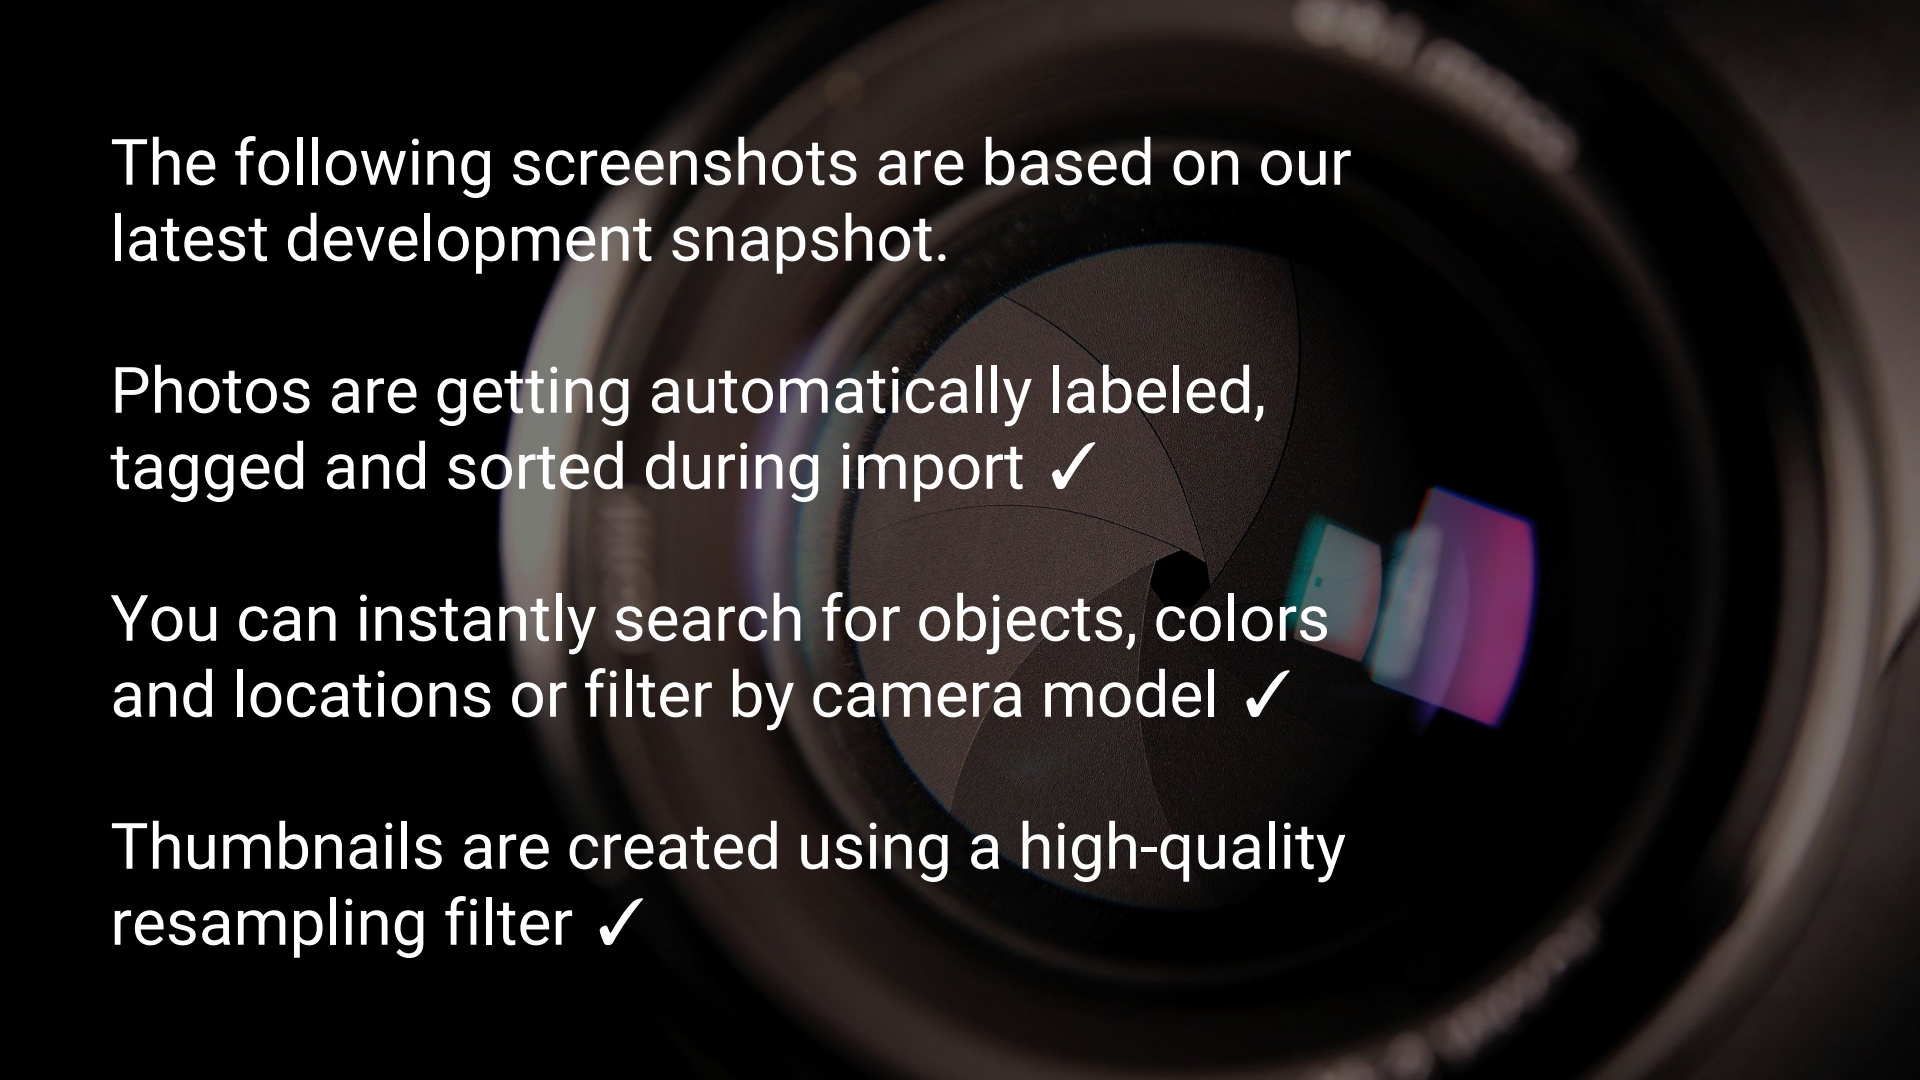

GitHub has a full list of
source code contributors

What to expect

Clearly structured Web interface for browsing, organizing and sharing personal photo collections.

Reverse geocoding and automated tagging based on Google TensorFlow.

Single binary built with Go. Runs on almost every computer.

The background of the slide is a close-up, artistic photograph of a camera lens. The lens is the central focus, with its various elements and the aperture visible. The background is dark and out of focus, showing the circular patterns of the lens housing. The text is overlaid on the left side of the image in a white, sans-serif font.

The following screenshots are based on our latest development snapshot.

Photos are getting automatically labeled, tagged and sorted during import ✓

You can instantly search for objects, colors and locations or filter by camera model ✓

Thumbnails are created using a high-quality resampling filter ✓

- Blue circle with white magnifying glass
- Purple circle with white heart
- Grey circle with white hamburger menu

Why this has to be free and open-source

We've built similar applications in corporate environments before. Every single time, the focus on monetization was an impediment.

We are sure we can do better with only a fraction of the budget. Simplicity can be very powerful. Go itself is a great example.

We believe that software for managing personal visual memories is fundamentally different. Our users expect full transparency and control over their data.

More than 2,800 stars on GitHub confirm this assumption.

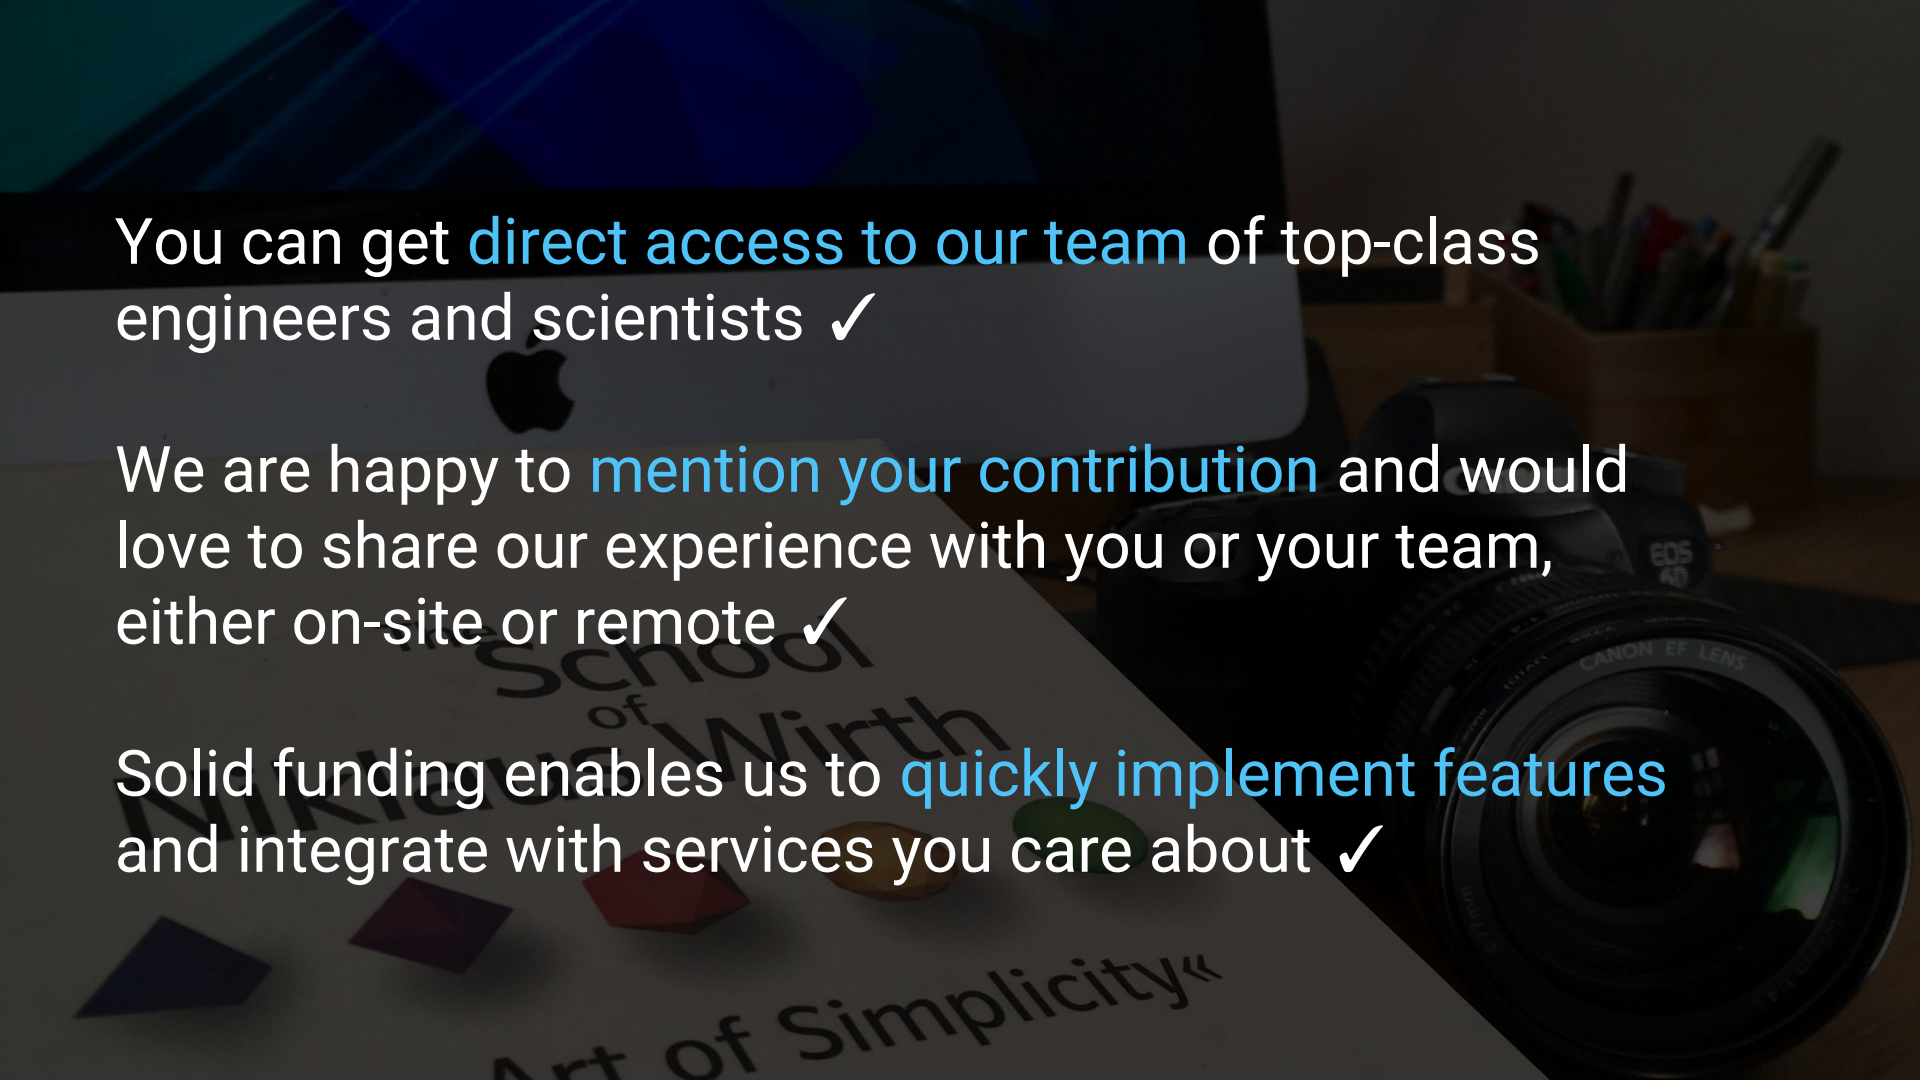

Our long-term goal is to become an open platform for machine learning research based on real-world photo collections.

Let's join forces

Become a sponsor on [Patreon](#) or [get in touch with us](#) to discuss further details.

Grants and donations will be used for organizing meetups, running our servers, visiting conferences, buying test devices, offering rewards for contributions, and covering our cost of living.

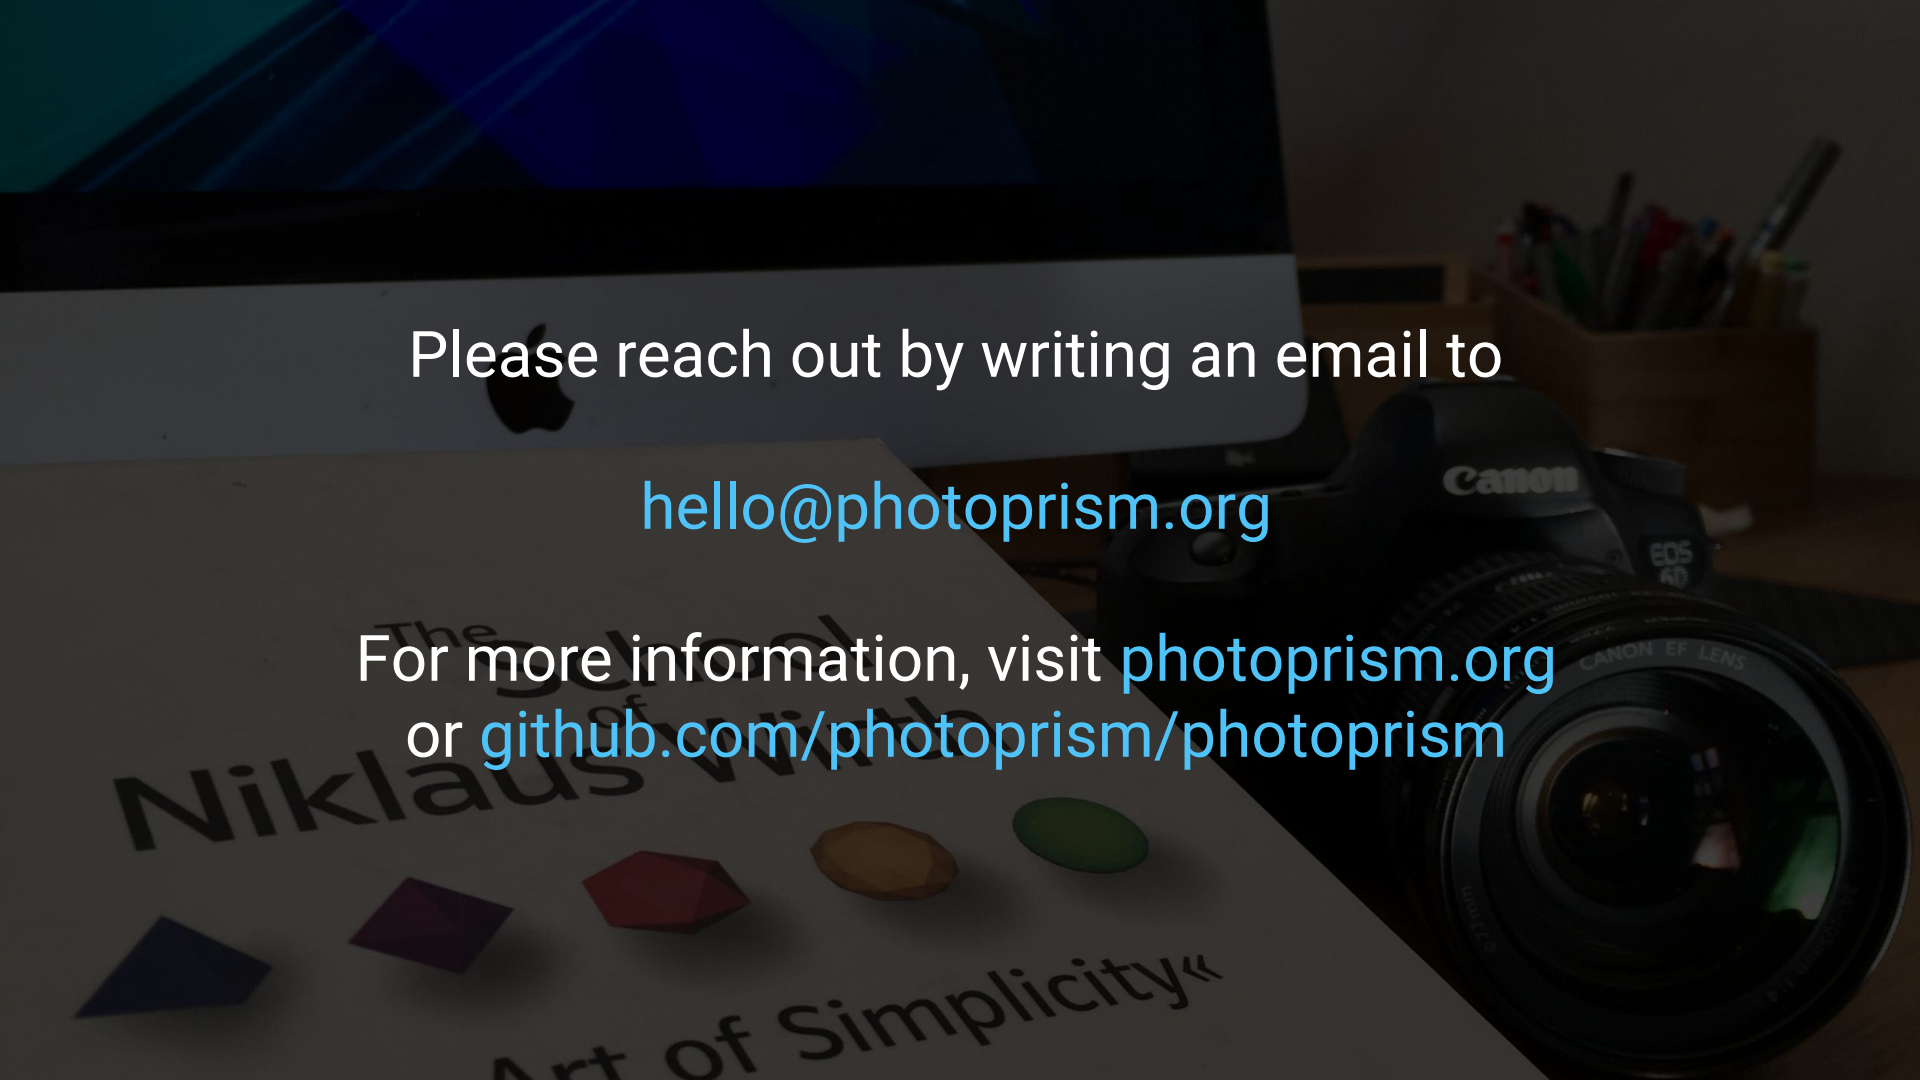

Art of Simplicity

You can get **direct access to our team** of top-class engineers and scientists ✓

We are happy to **mention your contribution** and would love to share our experience with you or your team, either on-site or remote ✓

Solid funding enables us to **quickly implement features** and integrate with services you care about ✓
